

Fixed False Piece

Fixed False Piece

Nowadays, bridges made only of metal are practically unacceptable.

Metalic bridge, without covering	Porcelain bridges	
 <p data-bbox="183 1160 486 1301">Complete gold bridge without covering</p>	 <p data-bbox="571 1160 1002 1352">Front view of three part metalic bridge, with porcelain covering.</p>	 <p data-bbox="1066 1160 1433 1256">Lower view of the same bridge</p>

False pieces are aesthetically more acceptable when they have a porcelain covering. The covering is applied over a metallic crown in an individual way for each patient. Porcelain is more compatible with tissue than synthetic material so does not cause allergic reactions.

The porcelain doesn't stain, because it is more hardwearing. The entire surface can be covered with porcelain. This provides better aesthetic results as all surfaces of the tooth can be a natural colour.

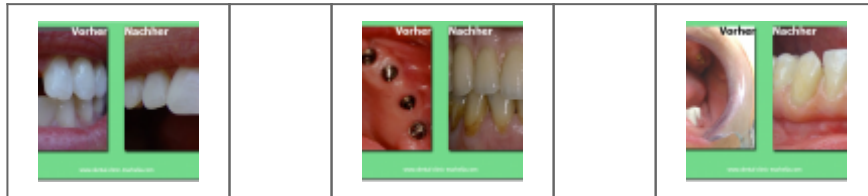

Bridges made completely of ZIRCON

The most aesthetically perfect bridge is one which is made completely of ZIRCON.

Light which is reflected in false pieces actually penetrates as it does in a natural tooth. In the inevitable event of the gums contracting, there are no black borders.
